MEDICAL USE OF DIAZABICYCLONONENE DERIVATIVES AS INHIBITORS OF PARASITE ASPARTIC
PROTEASES

- 5 In an earlier patent application, first published as WO 03/093267 A1 filed by the applicant (Actelion Pharmaceuticals Ltd), novel diazabicyclononene derivatives and their preparation as well as their use, especially as renin inhibitors, have been described. It has now been found that these compounds inhibit plasmepsin II. They are therefore useful as antimalarials.
- 10 The present invention is concerned with the use of diazabicyclononene derivatives against malaria pathogens and, in particular, relates to compounds of the general formula I. The invention also concerns related aspects including processes for the preparation of the compounds, pharmaceutical compositions containing one or more compounds of formula I and especially their use as plasmepsin II inhibitors
- 15 for the treatment of malaria. Furthermore, these compounds can be regarded as inhibitors of other aspartyl proteases and might, therefore, be useful as inhibitors of plasmepsin I, plasmepsin IV or histo-aspartic protease (HAP) to treat malaria and as inhibitors of *Candida albicans* secreted aspartyl proteases to treat fungal infections.

20

Background of the invention:

- Malaria is one of the most serious and complex health problems affecting humanity in the 21st century. The disease affects about 300 million people worldwide, killing 1 to 1.5 million people every year. Malaria is an infectious
- 25 disease caused by four species of the protozoan parasite Plasmodium, *P. falciparum* being the most severe of the four. All attempts to develop vaccines against *P. falciparum* have failed so far. Therefore, therapies and preventive measures against malaria are confined to drugs. However, resistance to many of the currently available antimalarial drugs is spreading rapidly and new drugs are
- 30 needed.
- P. falciparum* enters the human body by way of bites of the female anopheles mosquito. The plasmodium parasite initially populates the liver, and during later

- stages of the infectious cycle reproduces in red blood cells. During this stage, the parasite degrades hemoglobin and uses the degradation products as nutrients for growth [1]. Hemoglobin degradation is mediated by serine proteases and aspartic proteases. Aspartic proteases have been shown to be indispensable to parasite growth. A non-selective inhibitor of aspartic proteases, pepstatin, inhibits the growth of *P. falciparum* in red blood cells in vitro. The same results have been obtained with analogs of pepstatin [2], [3]. These results show that inhibition of parasite aspartic proteases interferes with the life cycle of *P. falciparum*. Consequently, aspartic proteases are targets for antimalarial drug development.
- 10 The present invention relates to the identification of low molecular weight, non-peptidic inhibitors of the plasmodium falciparum protease plasmepsin II or other related aspartic proteases to treat and/or prevent malaria.

Prior Art:

- 15 To date several classes of plasmepsin II inhibitors have been described in the literature. To the best of our knowledge, none of these compounds has entered clinical development so far. Research efforts within different structural classes of plasmepsin II inhibitors have recently been summarized and published [C. Boss et al.; *Curr. Med. Chem.* **2003**, *10*, 883-907 and references cited there]. Plasmepsin inhibitors based on a peptidomimetic or substrate-analogue approach are described in the following patents: US-05734054 (Pharmacoepia Inc), US-05892038 (Pharmacoepia Inc.), WO-00114331 (University of California, Berkley), WO-02074719 (Johns Hopkins University), and publications: D.

Chem.*, **2003**, *11*, 827-841. Non-peptidomimetic plasmepsin II inhibitors are described in the following publications: WO-00224649 (Actelion Pharmaceuticals Ltd.), WO-00238543 (Actelion Pharmaceuticals Ltd.) and WO-09912532 (F. The compounds of general formula I were tested against plasmepsin II, HIV-protease, human cathepsin D, human cathepsin E and human renin in order to determine their biological activity and their selectivity profile.

10 In vitro Assays:

The fluorescence resonance energy transfer (FRET) assay for HIV, plasmepsin II, human cathepsin D and human cathepsin E.

15 The assay conditions were selected according to reports in the literature [4 - 7]. The FRET assay was performed in white polysorp plates (Fluoronunc, cat n° 437842 A). The assay buffer consisted of 50 mM sodium acetate pH 5, 12,5% glycerol, 0.1% BSA + 392 mM NaCl (for HIV-protease).

The incubates per well were composed of:

- 20 - 160 µl buffer
 - 10 µl inhibitor (in DMSO)
 - 10 µl of the corresponding substrate in DMSO (see table A) to a final concentration of 1 µM
 - 20 µl of enzyme to a final amount of x ng per assay tube (x = 10 ng/assay
25 tube plasmepsin II, x = 100 ng/assay tube HIV-protease, x = 10 ng/assay
 tube human cathepsin E and x = 20 ng/assay tube human cathepsin D)

The reactions were initiated by addition of the enzyme. The assay was incubated at 37°C for 30 min (for human cathepsin E), 40 min (for plasmepsin II and HIV-protease) or 120 min (for human cathepsin D). The reactions were stopped by
30 adding 10% (v/v) of a 1 M solution of Tris-base. Product-accumulation was monitored by measuring the fluorescence at 460 nm.

Auto-fluorescence of all the test substances is determined in assay buffer in the absence of substrate and enzyme and this value was

- 5 The compounds of formula I and their pharmaceutically acceptable acid addition salts can be used as medicaments, e. g. in the form of pharmaceutical preparations for enteral, parenteral, or topical administration. They can be administered, for example, perorally, e. g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions; rectally, e. g. in the form of suppositories, parenterally, e. g. in the form of injection solutions or infusion solutions, or topically, e. g. in the form of ointments, creams or oils.

The production of pharmaceutical preparations can be effected in a manner which will be familiar to any person skilled in the art by bringing the described compounds of formula I and their pharmaceutically acceptable acid addition salts, optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants in a manner known per se.

20 Suitable carrier materials are not only inorganic carrier materials, but also organic carrier materials. Thus, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts can be used as carrier materials for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carrier materials for soft gelatine capsules are, for example, vegetable oils, waxes, fats and semi-solid and liquid polyols (depending on the nature of the active ingredient no carriers are, however, required in the case of soft gelatine capsules). Suitable carrier materials for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar and the like. Suitable carrier materials for injections are, for example, water, alcohols, polyols, glycerols and vegetable oils. Suitable carrier materials for suppositories are, for example, natural or hardened oils, waxes, fats and semi-liquid or liquid polyols. Suitable carrier materials for topical

preparations are glycerides, semi-synthetic and synthetic glycerides, hydrogenated oils, liquid waxes, liquid paraffins, liquid fatty alcohols, sterols, polyethylene glycols and cellulose derivatives.

- 5 Usual stabilizers, preservatives, wetting and emulsifying agents, consistency-improving agents, flavour-improving agents, salts for varying the osmotic pressure, buffer substances, solubilizers, colorants and masking agents and antioxidants come into consideration as pharmaceutical adjuvants.

Synthetic Approaches for the preparation of compounds of general formula I:

Preparation of the precursors:

- 20 Precursors are compounds which were prepared as key intermediates and/or building blocks and which were suitable for further transformations in parallel chemistry.

Bicyclononanone **A** was prepared from (4-benzyl-6-ethoxycarbonylmethyl-1-methylpiperazin-2-yl) acetic acid ethyl ester (Patent Application WO92/05174) as described in Scheme 1. Derivative **A** might also be present as enol form. In order to allow a coupling at the 7-position of bicyclononanone **A** with aryl bromides, the vinyl triflate derivative **B** was prepared.

Scheme 1

10

The bromoaryl components can be prepared as described in Scheme 2. A *Mitsunobu* coupling (\rightarrow compounds of type **C**) or the alkylation of an alcohol with a benzylic chloride (or bromide, \rightarrow compounds of type **D**) are often the most convenient methods. Derivatives **E** and **F** were prepared in one step from 1-(3-chloropropoxymethyl)-2-methoxybenzene (Vieira E. *et al.*, *Bioorg. Med. Chem. Letters*, 1999, 9, 1397) or 3-(5-bromopyridin-2-yloxy)propan-1-ol (Patent Application WO 98/39328) according to these methods. Other methods for the preparation of ethers or thioethers, like a *Williamson* synthesis, might be used as well (see e.g. March, J, "Advanced Organic Chemistry," 3rd ed., John Wiley and sons, 1985).

20

Scheme 2

- 5 As shown in Scheme 3, these bromoaryl derivatives might then be coupled to triflate **B** in the presence of $Pd(PPh_3)_4$ or a related $Pd(0)$ -complex in order to obtain bicyclononenes **G** (for details see the corresponding examples). Protective group manipulation would lead to the bicyclononenes **H**, which can finally be reduced to the alcohol derivatives **J**.

Scheme 3

- 5 If R^a is O-SEM and X is CH_3 , in compounds of type J, the SEM-protecting group can be cleaved under slightly acidic conditions, while the Boc-protecting group remains untouched as illustrated in Scheme 4. The phenolic moiety of bicyclononene K might then be alkylated to bicyclononene L. This alcohol intermediate would be transformed into the ester M, and the Boc-protecting group
- 10 can finally be cleaved to yield precursor N.

Scheme 4

- 5 If X is N (Scheme 3), bicyclononenes of type J can be esterified to bicyclononenes O that can be deprotected to precursors P (Scheme 5).

Scheme 5

- 10 If, in alcohols J, X is CH (Scheme 6) and, for instance, R^a is O(CH₂)_qOTBDMS or (CH₂)_qOTBDMS (Scheme 3), an esterification might lead to bicyclononenes Q (Scheme 6). Under acidic conditions, both the Boc- and the TBDMS-groups would be cleaved and the secondary amine might be acylated, sulfonated, or
15 alkylated to yield precursors R.

Scheme 6

5

As illustrated in Scheme 7, the Boc-protecting group of bicyclononenes **H** might be cleaved and the resulting secondary amine acylated, sulfonated, or *N*-alkylated to bicyclononenes **S**. Saponification of the ester would lead to precursors **T**. If, for instance, R^a is $O(CH_2)_nOTBDMS$ or $(CH_2)_nOTBDMS$, the silyl ether might be

10 cleaved simultaneously during the cleavage of the Boc-protecting group or during the saponification. The acid might be transformed into an amide to lead to precursors **U**. Alternatively, amides **U** can be prepared from bicyclononenes **H** through the acids **V**, with simultaneous cleavage of the silyl ether. Reaction of the

15 acids **V** with amines might give the amides **W** that can be transformed into precursors **U**. The amines can be prepared according to the literature or as described in the experimental part.

Scheme 7

- 5 As illustrated in Scheme 8, the bicyclic nonenes S might be reduced to the corresponding alcohols X. The alcohol derivative X might then be oxidised to the aldehydes Y, which might be transformed to the precursors Z by reductive amination.

Scheme 8

- 5 As shown in Scheme 9, a compound of type H might also be saponified to a compound of type AA. After amide coupling to a derivative of type AB, removal of the Boc-group would yield a precursor of type AC.

Scheme 9

10

As illustrated in Scheme 10, a compound of type **S** might also be transformed into a compound of type **AH** that in turn can be saponified to a precursor of type **AJ**.

Scheme 10

5

Alternatively precursors of type **AJ** might be prepared from bicyclononanone **A**, but using the benzyl ester instead of the ethyl ester, as illustrated in Scheme 11.

10 After a transesterification to compound **AM** similar reactions as described here above would lead to compounds **AN**, **AO**, **AP**, **AQ**, **AR** and finally **AJ**.

Scheme 11

5

As shown in Scheme 12 a precursor of type AL might be prepared as well in two steps from a compound of type W.

Scheme 12

10

Sometimes it might be necessary to transform a substituent further after attaching it on the bicyclic template. For instance a compound of type AS, obtained by amide coupling from a compound of type AJ, might be transformed into a precursor of type AT, AU, or AV, as illustrated in Scheme 13.

5

Scheme 13

- 10 As illustrated in Scheme 14 compounds of type H might be deprotected into compounds of type AW. This type of compounds might be then transformed into compounds of type AX and finally into compounds of type AY. Compounds of type AY might also be prepared from compounds of type AP. Compounds of type AY might be transformed into compounds of type AK. Compounds of type
- 15 AK might be finally transformed into precursors of type AL.

Scheme 14

- 5 Alternatively, as shown in Scheme 15, AX might be transformed into a compound of type BL, than might be then lead to a compound of type AJ.

Scheme 15

- 5 As shown in Scheme 16 compounds of type **H** or **S** might be transformed into compounds of type **AZ** (the substituent at the N(3) position be L or Boc). Then compounds of type **T** might be obtained that might be then transformed into compounds of type **BA**. Finally precursors of type **BB** might be prepared.

10-

Scheme 16

Also, as shown in Scheme 17, compounds of type **AK** might be transformed into precursors of type **BC**.

Scheme 17

- 5 Also, a compound of type **S** might be transformed into a compound of type **BM**, as shown in Scheme 18. A compound of type **BM** might be then saponified into a precursor of type **BN**.

Scheme 18

10

Preparation of the secondary amines

- 15 It might be necessary to prepare secondary amines as well. This might be done by reductive amination from the corresponding amine and aldehyde, or by amide coupling, from the corresponding amine and carboxylic acid, followed by reduction with LAH or borane. These standard procedures are well-described in the literature. (2-Allylphenyl)cyclopropylamine, necessary for instance in Scheme
- 20 13, might be prepared by allylation of 2-bromobenzaldehyde, protected as an acetal; subsequent deprotection to the 2-allylbenzaldehyde and reductive amination would lead to the desired amine.

Preparation of final compounds

From precursors prepared as described above, the final compounds can be prepared using parallel chemistry techniques. For the specific examples, see the experimental part.

Diazabicyclononenes of type of **N** can be acylated, or alkylated, or sulfonated, using standard procedures (Scheme 19), and then directly deprotected to yield the final compounds (for numbering, see specific examples). In each case, purification by preparative HPLC might give the corresponding TFA salts or formate salts.

Scheme 19

Precursors **R**, **U** or **BB** (with a **L**-substituent at the N(3)-position) might be transformed into the corresponding aryl ethers (Scheme 20), using the *Mitsunobu* reaction conditions. After deprotection, the final compounds are obtained:

Scheme 20

- 5 Precursors **T**, **AJ** or **AV** might be submitted to an amide coupling (Scheme 21). Deprotection would lead to the desired final compounds.

Scheme 21

Compounds **Z** might be reacted with acylating (or sulfonating) reagents to lead to the corresponding amides (or sulfonamides) as well (Scheme 22). Deprotection would lead to the final compounds.

Scheme 22

- 5 Compounds of type **AC** or **AL** can be reacted as well with acylating, sulfonating or alkylating reagents (Scheme 23). After deprotection, the final compounds would be obtained.

Scheme 23

10

Precursors of type **BC** might also lead to final compounds as indicated in Scheme 24.

15

Scheme 24

Enantioselective synthesis:

The compounds of the present invention contain at least two chiral centers which, however, are not independent from each other. The synthetic methods presented so far might lead to racemates. Both enantiomers might be prepared selectively starting from a *meso*-bicyclononane derivative, like compound **AD** (Blount B. K., Robinson, R., *J. Chem. Soc.*, 1932, 2485) or **AE**, prepared similarly to compound **A** with a subsequent decarboxylation (Scheme 25). For instance, compound **AE** might be stereoselectively acylated to bicyclononane-derivatives **AF** or **AG** as already described elsewhere for similar compounds (Majewski M., Lasny R., *J. Org. Chem.*, 1995, 60, 5825). Similarly, the other enantiomer might be prepared.

Scheme 25

Finally precursor **BK** might be prepared as described in Scheme 26.

Preparation of the final compounds

10

Typical procedure (A) for the acylation:

- To a solution of bicyclononene in anhydrous EtOAc was added vacuum dried-Amberlyst 21 (1.5 g/mmol of bicyclononene) or another suitable scavenger,
15 followed by the addition of the desired acid chloride (1.5 eq.). After shaking the suspension for 3 h, an aliquot water was added and shaking was continued for 1 h. The resin was then removed by filtration, washed with EtOAc and the filtrate was evaporated to yield the intermediate amide.

- 20 The synthesis of the sulfonamide, carbamate or urea derivatives was performed in analogy to the above-described procedure, by using the corresponding sulfonyl chloride, chloroformate or carbamoyl chloride respectively.

Typical procedure (B) for amide formation from acid chlorides:

25

- To a sol. of the acid chloride (1 eq.) in CH₂Cl₂ (2.5 mL/mmol) at 0 °C. the amine (3 eq.) was added. The mixture was stirred for 3 h while warming up slowly to rt. If necessary, more CH₂Cl₂ was added, then the reaction mixture was washed with aq. sat. NaHCO₃ (1x) and aq. 1M HCl (1x). The extracts were dried over MgSO₄
30 and the solvents were removed under reduced pressure. The obtained product was used without further purification.

Typical procedure (C) for an amide coupling with CDI

To a sol. of the carboxylic acid (1 eq.) in CH₂Cl₂ (4 mL/mmol) CDI (1 eq.) was added. The sol. or suspension was stirred for 2 h at rt, then cooled to 0 °C. The
5 amine (6 eq.) was added and the sol. or suspension was stirred for 2 h while warming up slowly to rt. The sol. or suspension was washed with water (1x). The org. extracts were evaporated under reduced pressure and the obtained residue was used further without purification.

10 *Typical procedure (D) for the reduction of an amide to an amine with LAH*

To a sol. of the amide (1 eq.) was dissolved in THF (3 mL/mmol) LAH (1M in THF, 3 eq.) was added carefully. The mixture was stirred at rt for 30 min, then heated to 60 °C for 3 h before it was allowed to cool down to rt, then to 0 °C. For
15 x g of LiAlH₄ initially added, was added x g of water, then x g of aq. 15% NaOH, and finally 3x g of water again. The resulting mixture was stirred overnight, filtered, and the precipitate washed with EtOAc. The filtrate was evaporated under reduced pressure and the residue diluted in a small amount of MeOH. The sol. was passed through a pad of SCX silica gel (sulfonic acid). Elution started
20 with MeOH, followed by NH₃/MeOH. The amines eluted with the second second eluent. The solvents were removed under reduced pressure. The isolated amines were either used without further purification or purified by HPLC, depending on the purity.

25 *Typical procedure (E) for the cleavage of the 2,2,2-trichloro-1,1-dimethylethylcarbamate protecting group:*

The crude product from another typical procedure was dissolved in THF/AcOH (1:0.1) and treated with zinc (20 eq.). The suspension was stirred for 5 h and
30 filtered through celite, which was washed with EtOAc. The filtrate was evaporated under reduced pressure and the residue was purified by HPLC.

TMAD (0.075 mmol) in toluene (0.50 mL) was added, followed by tributylphosphine (0.15 mmol). The reaction mixture was stirred for 2 h at rt and then 2 h at 60 °C. Sometimes, it was necessary to add a second portion of tributylphosphine and to stir overnight. Sometimes, THF was necessary as cosolvent to dissolve the reactants. The reaction mixture was allowed to cool to rt, then water was added. The mixture was extracted with EtOAc, and the org. extracts were evaporated under reduced pressure.

DIPEA (0.10 mmol), DMAP (0.01 mmol), HOBt (0.01 mmol), and EDC·HCl (0.05 mmol) were added and the reaction mixture was stirred overnight. Sometimes, it was necessary to add another portion of acid, DMAP, HOBt and EDC·HCl and to continue stirring for 24 h. CH_2Cl_2 was added and the mixture was washed with water. The org. extracts were separated, dried over Na_2SO_4 and filtered. The solvent was removed under reduced pressure.

To a sol. of the bicyclononene (0.05 mmol) CHCl_3 or CH_2Cl_2 (2 mL) the desired amine (commercially available or prepared following known, standard procedures) (0.10 mmol) was added. DIPEA (0.10 mmol), DMAP (0.01 mmol), HOBt (0.01 mmol) and EDC·HCl (0.05 mmol) were added. The reaction mixture was stirred overnight. Sometimes, it was necessary to add another portion of amine, DMAP, HOBt and EDC·HCl and to continue stirring the sol. for 24 h. CH_2Cl_2 was added and the mixture was washed with water. Sodium borohydride (1.2 eq.) was added portionwise at 0°C and then stirring was continued, at rt, for 4h. A solution of NaOH 1N was added and the MeOH was evaporated. The mixture was extracted
10 with EtOAc twice and the organic layer was washed with brine, dried over Na₂SO₄ and filtered. The solvent was removed under reduced pressure. The isolated amines were either used without further purification or purified by flash chromatography (EtOAc/heptane: 2/8), depending on the purity.

15 *Typical procedure (K) for an anhydride coupling*

To a sol. of the bicyclononene (0.05 mmol) in CH₂Cl₂ (0.4 mL) was added DIPEA (0.1 mmol) followed by the anhydride (0.06 mmol) in CH₂Cl₂ (0.4 mL) at 0°C. After stirring for 3h at rt, the solvent was evaporated under reduced pressure.

Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 6-9 and 14-17 are directed to methods of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compounds/compositions.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
